

Task: Personal Website
Unit Objectives: L02, L03, L04
Due Date: Monday of Week 7, 11:59 pm
Weight: 40%
Must be completed as individuals.

Task Description:

Your task is to create a content management system (Wordpress) site on the provided webspace. You should use the Astra theme to style your site and the Elementor page builder for your page and post content. Module 5 will help you to understand what is required to do this. You cannot use any of the built-in Elementor templates nor any other web-based templates you can find.

The Wordpress site should be developed at:

12345678.it.scu.edu.au/wp/

where 12345678 is your studentID.

For content, you can choose either to convert the content from your previous personal site to this site, or you can start with a different set of content. Either way, you should use 'best practice' throughout when setting up and developing your WordPress website as demonstrated in the video content in Module 5.

You need at least **three pages of content** and an **additional page** to explain an area of ethics and professionalism (Module 6 will explain this requirement). You should also have **at least one post**.

Apart from this, you can use this as a creative exercise. As with Assignment 2, you should be thinking about the audience you want to reach, and the look and feel that will best support your communication. It is YOUR choice of colours, layout and content, so if you create a suitable site, this can be used throughout your studies as you will keep this webspace throughout your study in the BIT.

Marking Criteria:

The rubric for this assignment is available on the MySCU site and will give the criteria for marking.

Generally, you need to not only concentrate on getting the installation and configuration of the website correct, but also think about how you are presenting the website and how you are demonstrating your learning. There are two parts of the marking criteria – the technical competency, and the level of professional web development shown.

The difference between a "Pass" and higher grades will be based on:

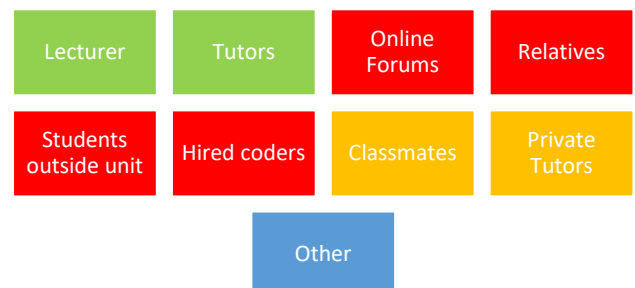

- How carefully you look at the whole project and development practices;
- How well you follow best practices while keeping your website cohesive and attractive;
- How well you apply your knowledge of HTML and CSS when configuring your theme and the elements added to your page using the page builder.

Getting Help:

This assignment, which is to be completed individually, is your chance to gain an understanding of the fundamental concepts of html and css on which later learning will be based. It is important that you master these concepts yourself.

Since you are mastering fundamental skills, you are permitted to work from the examples in the MySCU site or textbook, but you must acknowledge assistance from other textbooks or classmates. In particular, you must not use online material or help from others, as this would prevent you from mastering these concepts.

This diagram will help you understand where you can get help:
